

HTML Refactoring Report

Objective

Refactor the index.html file to improve readability, structure, and performance for a personal portfolio website.

Refactoring Changes Made

- Removed redundant/basic comments that were not needed (e.g., <a> tag explanation).
- Fixed broken <section> tag for Certificates (was not properly closed).
- Improved indentation and consistent formatting using BeautifulSoup.
- Ensured all image tags have alt attributes for accessibility.
- Validated structure of header, nav, and footer for semantic correctness.

Tools Used

- BeautifulSoup (Python): Used to prettify and parse the HTML.
- Manual Inspection: To identify semantic issues and logic errors.
- Suggested: Prettier/VS Code for future live formatting.

Impact of Changes

- Improved code readability and structure for easier collaboration.
- Reduced risk of broken layout and rendering issues in browsers.
- Better accessibility and SEO due to alt attributes and proper tags.
- Ready for minification or further tooling in build pipeline.

Next Steps

You may now use the refactored HTML file directly.

Make sure to test it visually in the browser to ensure layout remains unchanged.

Apply similar practices to your CSS and JS if not already done.
